

QEVRYN Cybersecurity Whitepaper

Threat Modeling & Cryptographic Isolation | Built by Veeomdecoders

1. Core Local Isolation:

QEVRYN binds node-servers strictly to local interfaces (127.0.0.1).
All secret API keys reside strictly inside private operating memory.

2. Coding Sandbox Controls:

Active regex-based string filters evaluate all proposed shell execution commands.
Unsafe actions (rm -rf, format, etc.) are blocked immediately.

3. Visual Diff Guards:

The agent is restricted from making direct file writes without displaying
a split diff and asking the user for explicit authorization.

4. Checksum Integrity:

All downloaded model weights and packages are scanned using SHA-256
checksum matching to guard against supply-chain intercept threats.

Authorized release,

Chief Technology Officer, Veeomdecoders
